

MDMA pocket card

THRESHOLD · HARM REDUCTION

TEST

Reagent kit + fentanyl strip. No reagent finds fentanyl. Not what you expected? Don't take it.

DOSE

Roughly 1-1.5 mg/kg, under ~120 mg. Take a test dose, then wait.

DON'T CHASE IT

One small top-up at most. Redosing drives the worst comedown.

NEVER MIX

MAOIs (can be fatal), SSRIs/SNRIs, tramadol, high-dose stimulants. Careful with alcohol.

STAY COOL

Breaks from dancing. Sip ~250-500 ml/hour with electrolytes. Not more.

THE DAYS AFTER

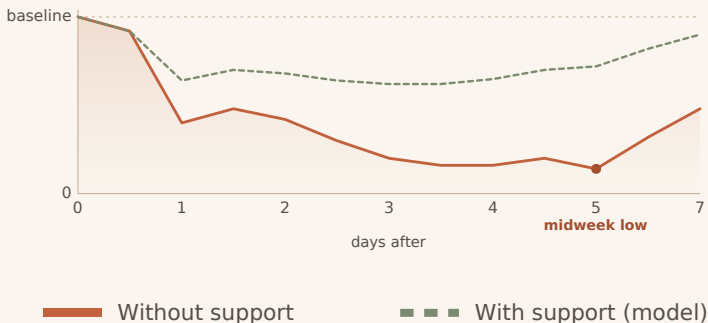

Sleep, food, downtime. A low around day 5 is normal. Don't stack another session.

EMERGENCY

Overheating, confusion, seizures, won't wake? Call emergency services now and say what was taken.

The week after

Serotonin dips, then recovers. Day 5 is often the hardest. Support softens the dip (illustrative model).

SOFTEN THE DIP

- Sleep and rest. Time does most of the work.
- Eat well; hydrate with electrolytes.
- Don't redose or stack another session.
- See a professional if the low lasts past 1-2 weeks.
